

SCIENCE FOUNDATIONS

Metrics, Numbers & Unit Analysis

The language every scientist speaks.

PART 1

Numbers Are the Language of Science

What Is Science, Really?

It's More Than Math

Science is the study of how nature works. It's full of concepts — motion, energy, forces, waves — and we describe those concepts through math and numbers.

Two Halves of the Same Coin

Science is BOTH:

- Qualitative — the concepts and stories
- Quantitative — the math and numbers

You need both to really understand.

Understanding Precision

Which of these is the most precise?

.2

1 sig fig

.21

2 sig figs

.20788

3 sig figs

.20787958

4 sig figs

.2078795764

5 sig figs

⚠ The catch

A number is only as precise as the tool that measured it. Writing .2078795764 when your ruler shows tenths is FALSE PRECISION.

Calculator Trap #1 — Too Many Decimals

Your Calculator

.2078795764

10 digits!

✗ Don't write this down.

What to Do

.208

Rounded to thousandths

✓ Match your data's precision.

'E' MEANS $\times 10$ TO THE POWER

Calculator Trap #2 — Scientific Notation on Screen

Calculator Shows

4.587E4

What does that even mean?

X Don't write '4.587E4' as your answer.

Write It Two Ways

4.587×10^4

Scientific notation

OR

45,870

Expanded form

From Atoms to Universes

HUGE

300,000 m

O'ahu → Big Island

$= 3.0 \times 10^5 \text{ m}$

TINY

.000000003 g

Mass of a mosquito

$= 3.0 \times 10^{-8} \text{ g}$

Scientific Notation

Positive Exponent = BIG

$$3.0 \times 10^5 = 300,000$$

Move the decimal 5 places to the RIGHT.

$3.0 \rightarrow 30 \rightarrow 300 \rightarrow 3,000 \rightarrow 30,000 \rightarrow 300,000$

Or: 'the number of zeros to add.'

Negative Exponent = TINY

$$3.0 \times 10^{-8} = .00000003$$

Move the decimal 8 places to the LEFT.

$3.0 \rightarrow .3 \rightarrow .03 \rightarrow \dots \rightarrow .00000003$

Or: 'number of decimal shifts.'

PART 2

The Metric System & SI Units

The SI Base Units

MASS

kilogram

(kg)

SI unit

LENGTH

meter

(m)

SI unit

VOLUME

liter

(L)

SI unit

TIME

second

(s)

SI unit

Why the Metric System?

ONLY 3

countries

out of ~195

do NOT officially
use the metric system:

United States
Liberia
Myanmar

Why It Matters

Scientists across every continent share data, compare results, and check each other's work. That only works if we all use the same system.

That system is SI (metric). If you want to talk science, you talk metric.

The Metric Ladder — KHDUdcm

King Henry Doesn't Usually Drink Chocolate Milk

← larger

smaller →

How to Convert Metric Units

1

Write the number

500 centimeters

2

Write KHDUdcm

K H D U d c m

3

Mark the starting prefix

...C...

4

Mark the target prefix

...U... (m)

5

Count spaces + direction

2 places LEFT

6

Move the decimal

500 → 5.00 m

⚠ Only works for units that are NOT squared or cubed.

Example — 500 cm → m

$$500 \text{ cm} = ? \text{ m}$$

end: U

start: c

← 2 places LEFT

$$500. \text{ cm} \rightarrow 5.00 \text{ m}$$

Practice — Try These

PROBLEM 1

Convert

4,000 m

→

? km

PROBLEM 2

Convert

45.5 L

→

? mL

PART 3

Unit Factor Conversions

Multiplying by 'One' — But Cleverly

1

Anything ÷ Itself = 1

60 minutes = 1 hour

So:

$(60 \text{ min}) \div (1 \text{ hour}) = 1$

$(1 \text{ hour}) \div (60 \text{ min}) = 1$

Multiplying by 1 doesn't change the value — but it CAN change the units.

Example — 2 hours = ? min

2 hours $\times$ (60 min / 1 hour)

= 2 $\times$ 60 min

= 120 minutes

The 'hours' cancel; the 'minutes' stay.

Rules for Setting Up Conversions

1

Start with what you have

Include the UNITS. 'Just numbers' is a recipe for errors.

2

Multiply by unit factors

A unit factor is a fraction with equal values in different units (1 cm = 10 mm).

3

Flip factors as needed

Choose the version where the unwanted unit cancels. Cross it out, then move on.

When There's No Direct Equality

How many centimeters are in 1 mile?

Known equalities: 1 inch = 2.54 cm • 1609 m = 1 mile

STEP 1

cm $\rightarrow$ m
(use KHDUdcm)

$$1 \text{ cm} = 0.01 \text{ m}$$

STEP 2

m $\rightarrow$ mile
(unit factor)

$$1609 \text{ m} = 1 \text{ mile}$$

STEP 3

Multiply chain

$$\begin{aligned} 1 \text{ mile} &\times 1609 \text{ m/mile} \\ &\times 100 \text{ cm/m} \\ &= 160,900 \text{ cm} \end{aligned}$$

Two Methods — At a Glance

Metric Conversions

1. Write down the number
2. Write KHDUdcm
3. Mark starting prefix
4. Mark target prefix
5. Count spaces + direction
6. Move the decimal

Best for: single-unit metric jumps (m → km, mg → g)

Unit Factor Method

1. Write down what you have (with units!)
2. Find an equality
3. Build unit factors (top or bottom)
4. Multiply so unwanted units cancel
5. Multiply tops, divide bottoms
6. Write final answer with units

Best for: any conversion (metric or not, squared/cubed)

HOMWORK

Metrics — Problem Sets

Complete the homework in your notebook. Show ALL work — you will be expected to solve the problems on the whiteboard in class. Box or circle your final answer with units.

PROBLEM SET #1

10 Unit Conversions

- 400 kg → g, 365 mL → cL
- 543,210 km → mm, 350 km → m
- 430 mL → L, 12 miles → m
- 3 days → hours, 79 days → seconds
- Oahu → CA in meters (2,500 mi)
- Ewa Beach → Kailua in miles (48 km)

Equalities: 1 mi = 1609 m • 2.54 cm = 1 in • K H D u d c m

PROBLEM SET #2

8 Reasoning Questions

- Read the meniscus in the graduated cylinder
- Convert that reading to L
- Coffee: 0.25 L vs. 250 mL — who drinks more?
- Why learn the metric system? (2–3 sentences)
- Which unit factor to pick, and why
- Compare: 1000 g vs 0.5 kg, 25 cm vs 2.5 m
- Explain: 500 cm = 5 m

Includes the graduated-cylinder meniscus figure — read at eye level.
